PROFESSIONAL SUMMARY

Backend engineer with 4+ years building payments infrastructure at scale in fintech. Led the V2 rewrite of a core payment methods service, built a device management system handling 10,000+ POS terminals, and designed partner-facing APIs consumed by 15+ external integrators. Deep in Node.js/NestJS, PostgreSQL, Redis, and distributed microservice architectures; recently shipping internal AI agents that cut operational workload by double-digit hours per week.

WORK EXPERIENCE

Surfboard Payments Pvt. Ltd.

May 2022 – Present

Software Engineer

Chennai, India

- Led the V2 rewrite of the payment methods service, replacing a legacy codebase with a modular **NestJS** implementation that cut production incidents by 40%.
- Built a **Device Management System** from scratch (data modeling, API design, hardware provisioning, granular access control) now managing 10,000+ payment terminals across 3 markets, reducing device provisioning time from ~45 minutes of manual setup to under 5 minutes.
- Architected the shipping provider migration and logistics infrastructure with secure asynchronous webhooks for real-time delivery lifecycle tracking, eliminating ~20 hours/week of manual order tracking and cutting delivery status lag from hours to under a minute.
- Designed and maintained developer and service-account APIs in a **NestJS** microservice with **JWT** authentication across multiple isolated environments, onboarding 15+ partner integrations with zero cross-environment security incidents.
- Defined API contracts, versioning, and deprecation workflows with partner teams and standardized integration documentation, cutting integration-related support tickets by ~35%.
- Consolidated shared business logic across ~87 microservices and introduced async messaging and caching layers, cutting redundant inter-service API calls by 13% and reducing p95 latency on high-traffic endpoints from 1.8s to under 600ms during peak load.
- Optimized **Prisma/PostgreSQL** schemas with JSONB types for dynamic merchant onboarding and targeted indexes, improving the slowest onboarding queries by 60–70%; hardened the data layer with a thread-safe connection module featuring graceful shutdown and proactive error handling.
- Built an internal ticketing system replacing ad-hoc Slack alerts, routing critical distributed-system events into a structured raise-monitor-resolve workflow and cutting mean time to acknowledge incidents by ~50%.
- Engineered autonomous AI agents and workflow automations for high-frequency operational tasks (device diagnostics, partner queries, deployment checks), saving the ops team an estimated 15+ hours/week.
- Shipped a **NestJS** telemetry service tracking API usage patterns across distributed services, and contributed core features to the external Developer Portal used by all partner integrators.

Core Illustrio Pvt. Ltd.

Feb 2022 – Apr 2022

Software Development Intern

Chennai, India

- Built a Library Management System in Node.js/Fastify with role-based access control, delivering separate admin and user interfaces for managing 1,000+ book and employee records.
- Prototyped an expense-sharing mobile app in Flutter, implementing the backend business logic and API layer end to end.

SKILLS

Languages	TypeScript, JavaScript, Python
Backend	Node.js, NestJS, Fastify, REST, gRPC, Webhooks
Databases	PostgreSQL (Prisma), Redis, MySQL, Firebase
Cloud & DevOps	Microsoft Azure (App Services, Azure DevOps CI/CD), Docker, Load Balancing, Swagger/OpenAPI
Architecture	Distributed Systems, Microservices, Event-Driven Design, Caching Strategies, API Versioning
AI & Automation	AI Agents, Workflow Automation, Prompt Engineering

CERTIFICATIONS

- Certified Associate In Product Management (CAPM), Institute of Product Leadership, Bangalore.
- Business English Certificate holder, achieving Grade C in Vantage Level competency.

PROJECTS

AI Developer Workflow Agents

- Built a suite of AI agents automating git workflows — commit, push, and merge requests from one prompt.
- Applied **prompt engineering** with the GitHub/GitLab API to turn plain-English intent into git actions.
- Extended the same framework to routine chores like status checks and PR follow-ups.

Car Repossession Rate Dashboard & Backend

- Built a backend and dashboard tracking vehicle repossession rates, replacing manual spreadsheet tracking.
- Surfaced overdue accounts and risk segments on the dashboard for faster collection decisions.

Library Management System — Full-Stack Application

- Built a full-stack LMS with a **Node.js/Fastify** backend and **Angular** frontend for 1,000+ records.
- Implemented **JWT**-based **RBAC** enforcing permission tiers across both API and UI layers.
- **Dockerized** the app behind a **load balancer**, with an indexed **MySQL** schema and **Swagger** docs.

EDUCATION

Bachelor of Engineering in Electronics and Instrumentation Engineering	2017 – 2021
St. Joseph’s College of Engineering, Chennai.	

CORE STRENGTHS

- Manages multiple high-priority backend features in parallel.
- Full cycle ownership — architecture design to cloud deployment.
- Strong external partner coordination and API contract negotiation.
- Comfortable across the full stack with deep backend specialization.
- Fast to pick up new tools, cloud services, and complex domains.
- Detail-oriented with a strong focus on high-throughput performance.
