Chennai, India

PROFESSIONAL SUMMARY

Backend engineer with 4+ years building payments infrastructure at scale in fintech. Led the V2 rewrite of a core payment methods service, built a device management system handling 10,000+ POS terminals, and designed partner-facing APIs consumed by 15+ external integrators. Deep in Node.js/NestJS, PostgreSQL, Redis, and distributed microservice architectures; recently shipping internal AI agents that cut operational workload by double-digit hours per week.

WORK EXPERIENCE

Surfboard Payments Pvt. Ltd.

May 2022 – Present

Software Engineer

Chennai, India

- Led the V2 rewrite of the payment methods service — replaced a legacy codebase with a modular NestJS implementation, cutting production incidents by 40%.
- Built a Device Management System from scratch (data modeling, API design, hardware provisioning, granular access control) now managing 10,000+ payment terminals across 3 markets; cut provisioning from ~45 min to under 5 min.
- Architected the shipping-provider migration and logistics infrastructure with secure async webhooks for real-time delivery lifecycle tracking — eliminated ~20 hrs/week of manual order tracking; delivery status lag from hours to under a minute.
- Designed and maintained developer and service-account APIs in a NestJS microservice with JWT auth across multiple isolated environments; onboarded 15+ partner integrations with zero cross-environment security incidents.
- Defined API contracts, versioning, and deprecation workflows with partner teams and standardized integration docs, cutting integration-related support tickets ~35%.
- Consolidated shared business logic across ~87 microservices and introduced async messaging + caching, cutting redundant inter-service calls 13% and p95 latency from 1.8s to under 600ms during peak load.
- Optimized Prisma/PostgreSQL schemas with JSONB for dynamic merchant onboarding and targeted indexes — slowest onboarding queries 60–70% faster; hardened the data layer with a thread-safe connection module (graceful shutdown, proactive error handling).
- Built an internal ticketing system replacing ad-hoc Slack alerts — routed critical distributed-system events into a raise-monitor-resolve workflow, cutting mean time to acknowledge incidents ~50%.
- Engineered autonomous AI agents and workflow automations for high-frequency ops (device diagnostics, partner queries, deployment checks), saving the ops team 15+ hrs/week.
- Shipped a NestJS telemetry service tracking API usage across distributed services and contributed core features to the external Developer Portal used by all partner integrators.

- Contributed to product direction for 2+ years — writing PRDs, mapping user flows, and shaping API and feature design from a product and end-user perspective with product stakeholders.

Core Illustrio Pvt. Ltd.
Software Development Intern

Feb 2022 – Apr 2022
Chennai, India

- Built a Library Management System in Node.js/Fastify with role-based access control — separate admin and user interfaces managing 1,000+ book and employee records.
- Prototyped an expense-sharing mobile app in Flutter, implementing the backend business logic and API layer end to end.

SKILLS

Languages	TypeScript, JavaScript, Python
Backend	Node.js, NestJS, Fastify, REST, gRPC, Webhooks
Databases	PostgreSQL (Prisma), Redis, MySQL, Firebase
Cloud & DevOps	Azure App Services, Azure DevOps CI/CD, Docker, Load Balancing, Swagger / OpenAPI
Architecture	Distributed Systems, Microservices, Event-Driven Design, Caching Strategies, API Versioning
AI & Automation	AI Agents, Workflow Automation, Prompt Engineering
Product	PRDs, User Flows, Wireframes, Information Architecture, Roadmapping

CERTIFICATIONS

- Certified Associate in Product Management (CAPM) — Institute of Product Leadership, Bangalore
- Business English Certificate (BEC) — Grade C, Vantage — Cambridge Assessment English

PROJECTS

AI Developer Workflow Agents A suite of AI agents that turn plain-English intent into git actions — commit, push, and merge requests from a single prompt. Prompt engineering over the GitHub/GitLab API, extended to routine chores like status checks and PR follow-ups.
Car Repossession Rate Dashboard Backend and dashboard tracking vehicle repossession rates — replaced manual spreadsheet tracking and surfaced overdue accounts and high-risk credit segments for faster collection decisions.
Full-Stack Load-Balanced LMS Full-stack library management system: Node.js/Fastify backend + Angular frontend for 1,000+ records, JWT-based RBAC across API and UI, dockerized behind a load balancer with an indexed MySQL schema and Swagger docs.

EDUCATION

B.E. Electronics & Instrumentation Engineering

2017 – 2021

CORE STRENGTHS

- Manages multiple high-priority backend features in parallel.
- Strong external partner coordination and API contract negotiation.
- Fast to pick up new tools, cloud services, and complex domains.
- Full-cycle ownership — architecture design to cloud deployment.
- Comfortable across the full stack with deep backend specialization.
- Detail-oriented with a strong focus on high-throughput performance.
