

Santhosh Rubenraj Solomon

Backend engineer, payments · Chennai, India

santhoshrubenc@gmail.com · linkedin/santhosh-ruben-raj-solomon · github/Santhosh-Rubenraj-Solomon

SUMMARY

Backend engineer with 4+ years building payment systems at scale in fintech. Led the V2 rewrite of a core payment methods service, built a device management system handling 2,500+ POS terminals, and owned the logistics platform that moves that hardware across five markets. Deep in Node.js/NestJS, PostgreSQL, Redis and distributed microservice architectures; recently shipping internal AI agents that cut operational workload by double-digit hours per week.

EXPERIENCE

Surfboard Payments Pvt. Ltd.

May 2022 – Present

Software Engineer

Chennai, India

-40%
incidents

Led the V2 rewrite of the **payment methods service** – the path every transaction routes through – replacing a legacy codebase with a modular NestJS implementation.

2,500+
terminals

Built a **Device Management System** from scratch – data modeling, API design, hardware provisioning, granular access control – now running across 3 markets. Provisioning fell from ~45 minutes of manual setup to under 5.

1 → 5
return markets

Built country-aware carrier routing for cross-border returns, taking return coverage from Sweden alone to five countries without duplicating the return flow.

2 carriers
one seam

Owned the returns platform migration from **Fraktjakt** to **nShift/Unifaun** behind a provider-agnostic shipping abstraction – both carriers live, selected by env flag, so a rollback is a config change, not a redeploy.

-20 hrs
per week

Re-architected the shipping integration with secure async webhooks for real-time delivery tracking, and automated return-label delivery – approval books the shipment, pulls the label inline and emails it to the merchant.

15+
integrations

Designed and maintained developer and service-account APIs in a NestJS microservice with **JWT** auth across isolated environments – onboarded every partner with zero cross-environment security incidents.

-35%
support tickets

Defined API contracts, versioning and deprecation workflows with partner teams, and standardised the integration documentation they build against.

1.8s → 0.6s
p95 latency

Consolidated shared business logic across ~87 microservices and introduced async messaging and caching, cutting redundant inter-service calls 13% at peak load.

60–70%
faster queries

Optimised **Prisma/PostgreSQL** schemas with JSONB for dynamic merchant onboarding and targeted indexes; hardened the data layer with a thread-safe connection module – graceful shutdown, proactive error handling.

-50%
time to ack

Replaced ad-hoc Slack alerts with an internal ticketing system, routing critical distributed-system events into a raise → monitor → resolve workflow.

15+ hrs
per week

Engineered autonomous **AI agents** and workflow automations for high-frequency ops: device diagnostics, partner queries, deployment checks.

2+ yrs
product

Contributed to product direction – writing PRDs, mapping user flows, and shaping API and feature design from the end user's side with product stakeholders.

Core Illustrio Pvt. Ltd.

Feb 2022 – Apr 2022

Software Development Intern

Chennai, India

1,000+
records

Built a Library Management System in Node.js/Fastify with role-based access control – separate admin and user interfaces over book and employee records.

Prototyped an expense-sharing mobile app in Flutter, implementing the backend business logic and API layer end to end.

SKILLS

languages	TypeScript, JavaScript, Python
backend	Node.js, NestJS, Fastify, REST, gRPC, Webhooks
data	PostgreSQL (Prisma), Redis, MySQL, Firebase
cloud / ops	Azure App Services, Azure DevOps CI/CD, Docker, load balancing, Swagger / OpenAPI
architecture	Distributed systems, microservices, event-driven design, caching strategies, API versioning
ai	AI agents, workflow automation, prompt engineering
product	PRDs, user flows, wireframes, information architecture, roadmapping

PROJECTS

bun · gemini

AI Diff Reviewer

Reviews the diff before it is pushed, feeding the model the repository's own history of the exact lines changed. Every finding must survive an argument against itself before it prints — no comment cap, and zero comments is a valid result.

nestjs · redis

AI-DS Ledger Reconciler

Distributed reconciler for duplicate payment webhooks across a cluster. The Redis lock is deliberately held past success so its TTL doubles as an idempotency window; an AI agent inspects the shared ledger and heals drifted transaction states.

node · sqlite

Car Repossession Rate Dashboard

Backend and dashboard tracking vehicle repossession rates, replacing manual spreadsheet tracking — segments risk by credit band, days past due and region, and ranks overdue accounts by the next action to take.

EDUCATION

B.E. Electronics & Instrumentation Engineering

2017 — 2021

St. Joseph's College of Engineering, Chennai

CERTIFICATIONS

- Certified Associate in Product Management (CAPM) — Institute of Product Leadership, Bangalore
- Business English Certificate (BEC) — Grade C, Vantage — Cambridge Assessment English

STRENGTHS

- Manages multiple high-priority backend features in parallel.
- Strong external partner coordination and API contract negotiation.
- Fast to pick up new tools, cloud services and complex domains.
- Full-cycle ownership — architecture design to cloud deployment.
- Comfortable across the full stack with deep backend specialisation.
- Detail-oriented, with a focus on high-throughput performance.
